Return to Eden — v1 screen, UX, and art-direction design

0. Gate, authority, and scope

This is a design artifact, not a build. **PM handoff is held until Brick explicitly signs off this design.** The acceptance flow remains: builder freezes a local artifact → Brick reviews the playable build and says approve, send back, or approve QA → only then does Scruffy verify the named hash (CADRE-INTAKE.md §Gates; EDEN-REQUIREMENTS.md §3 gate).

Authority order is: Brick's EDEN-COMBAT-DIRECTION.md and its C/A/B/M/N blocks, then REV 6 of EDEN-REQUIREMENTS.md , then the locked visual contract in STYLE-BIBLE.md . The frozen pre-overhaul HTML artifact is a feel/meta reference only; it is not a battle implementation source (EDEN-REQUIREMENTS.md §1, §2.1; CADRE-INTAKE.md D1b/D2).

Design approval packet

Brick is asked to approve the screen composition, interaction ownership, art pipeline, and the following documented defaults: **E4(a)** a spell costs nothing extra at cast; **E5(a)** an encounter upgrade may grant a whole card; **E6(a)** belt inventory contains consumables/spells only and cannot deploy a structure. These are not silently closed: they remain operator-overridable until sign-off (EDEN-REQUIREMENTS.md §8a, §8b; V2-35, V2-23, V2-34/V2-28).

The scope is desktop-width local Godot delivery at approximately 1280–1440 px, played through <http://localhost:8888/> . This artifact designs the battle screen, one between-battle map screen, shop,

encounter, belt/spells, Scrap presentation, node-region vocabulary, bunker presentation, and the asset pipeline. Mobile, public deployment, a navigable journey map, the old step-sim, heroes, extra factions, and every other REV 6 OUT item remain out (EDEN-REQUIREMENTS.md §4, §7; CADRE-INTAKE.md D1-D4).

1. Feature inventory and traceability

Each row is a design surface or behavior that the builder must expose. The references are the acceptance criteria that prove it; no row introduces a new gameplay system.

#	Feature/surface	Visible design decision	Acceptance trace	Depends on
F1	Local desktop shell	Menu starts the Godot run; the actual served build is fresh, nonblank, and local-only.	V2-01-V2-05; §7; D3	S1
F2	Battle field frame	One wide field: ally core/ship at left, enemy core at right, barriers and resource nodes visible, contested center kept open for lane pressure.	V2-14, V2-15, V2-25, V2-26; C8-C9; Style-Bible “Combat-frame composition”	S2
F3	Combat-card rail	Up to six cards occupy Q/W/E then A/S/D slots; locked unowned slots stay visible; placement is hover + card key.	V2-06-V2-13; C1-C9; §8b keys	F2
F4	Battle resources/readouts	Minerals ♦ and gas ♦ are visible in battle; card costs, per-card gas tech, core HP, army counts, enemy income, and bunker HP are readable without a hidden panel.	V2-08-V2-10, V2-14, V2-15, V2-27-V2-29; §2.5	F2, F3
F5	Economy-unit control	A dedicated on-screen economy button is separate from card keys and slots; its unit walks to authored nodes.	V2-24-V2-25, V2-29; M3; §8b	F2, F4
F6	Per-unit gas investment	A flat, in-battle panel has one row per unit type and exactly six axes plus special-card gating; one unit’s purchase cannot alter another.	V2-10, V2-27; A5-A6, M4; §8b	F3, F4
F7	Bunker placement/feedback	Dedicated build control, 60 ♦ default, one standing bunker, legal-zone ghost, static 260 HP shooter, visible travelling projectile, no blocking.	V2-28; B2; §8b	F2, F4
F8	Core slot/variants	Our core is a ship; the next encounter selects a data-driven enemy core variant, with at least two distinct variants.	V2-26; A4; §6.1	F2
F9	Between-battle map screen	A scene of its own replaces battle/reward views; it previews our ship, next core variant, and next encounter’s node markers.	V2-30; §2.4, §7; M1-M2/M5	F8, F10
F10	Node-region vocabulary	Every authored node has <code>side</code> , <code>region</code> , <code>pos</code> , <code>yield</code> ; regions are rear/flank/midfield/forward, with rear nodes for both sides and a node outside both rear pockets.	V2-25; §2.3; B0-B1, M1; §8b	F2, F9

#	Feature/surface	Visible design decision	Acceptance trace	Depends on
F11	Mixed Scrap shop	Map shop shows readable card, belt, and spell entries with individual Scrap prices; one purchase across the whole stock per map open.	V2-31, V2-36; M7-M8, N1/N3; §2.4-§2.5	F9, F12
F12	Investigate encounter	Optional single-card send, named three outcomes and odds before commit, at most one resolution per map open; E2(a) only “dies” removes a card.	V2-32-V2-33; M2/M5, E2(a), §8b	F9, F13
F13	Run progression/map cadence	Map opens after battles 1, 2, 3; roads appear after 1-2 only; third open has shop/encounter and one continue control.	V2-18-V2-23, V2-30; E3(a); §2.2/§2.4	F9, F11, F12
F14	Consumables belt	Four fixed slots; item + charges read in battle; 1/2/3/4 activate the corresponding slot; a zero-charge slot reads empty and inert.	V2-34; M6, N2, N4; §2.6, §8b	F4, F11
F15	Spells	Shop-bought spell is held outside belt slots, appears on its own cast control, casts once with fixed described target, and uncast spells ride forward.	V2-35; M6/M8, N3, E4(a); §2.6, §8b	F4, F11
F16	Scrap lifecycle	Starts at 0 per run, award is named on win, loss pays none, balance is map/shop-only, exact prices deduct, New Campaign resets it, recap names earned/spent.	V2-20, V2-31, V2-36; M7, N1/N3/N5; §2.5	F11, F13
F17	Art provenance/approval	Every new screen/art type receives a brief and reference review before implementation; final imported files have source, license/provenance, dimensions, hash, and an operator approval record.	V2-26, V2-28, V2-30, V2-31, V2-34-V2-35; §6.1; STYLE-BIBLE “show before build” rule	All visual surfaces

2. Surface plan

2.1 Battle screen — one field, one bottom HUD

The battle is a single wide field with no minimap and no mid-battle map overlay (EDEN-REQUIREMENTS.md §2.4, §4, V2-30). Use the locked live-frame composition: approximately the upper 85% is field and the lower 8-15% is a deep-indigo glass HUD (STYLE-BIBLE.md “Combat-frame composition reference”). The layout is anchored, not pixel-fixed, so it remains legible across the requested desktop range.

Field region (upper ~85%):

1. Far left: our anchored ship/core and ally barrier. Far right: the selected encounter's enemy core variant and enemy barrier. Core bars are also in the HUD; the field art is the immediate object.

1. Left/right environment uses the locked dirty battlefield treatment: cool teal ally side, warm ember enemy side, neutral/contested center glow, dust/crater depth, small outlined units. The center stays visually quieter behind the action so the units and projectiles read.

1. Resource-node sprites sit at authored `pos` values and carry a small region label or tooltip only when inspected. Node placement is data-driven and fixed for the battle; it never becomes capture, ownership-flip, or a live minimap (V2-25 ; §2.3; §4).

1. Bunker, when standing, sits in the player legal zone and reads as a compact static defensive object. Its shot is a short bright projectile path from muzzle to target, not an instant beam.

HUD region (bottom ~15%, opaque glass):

- **Top HUD line:** BATTLE N/4 , bracket, side, and compact left/right core HP bars. Minerals ♦ use ice-blue `#A0EFFF` ; gas ♦ uses ember-orange `#FF7A1A` ; Scrap is absent by rule.
- **Main card rail:** two rows of three compact card panels in acquisition order. Each panel shows its key (`Q W E / A S D`), name, unit art, mineral/gas cost, cooldown sweep, affordability, and per-unit gas-tech indicator. Locked slots remain visible and say `LOCKED` ; lost cards are not silently rebound (V2-06 , V2-10, V2-14, V2-23, V2-33).
- **Support rail:** a clearly separate support block contains the four belt slots, spell cast controls, the economy-unit button, bunker/build control, and a compact enemy-income readout. Labels must name input ownership: `1 2 3 4` for belt slots, `CAST` on spell controls, and a non-card `DEPLOY ECONOMY / BUILD BUNKER` control. Do not place belt items or spells into card slots or reuse card keys (V2-24 , V2-34, V2-35; M3, N4).
- **Focus/disabled states:** a hovered card or control lifts its edge and shows the target; an unaffordable card/control is dimmed with a reason; cooldown is a visible sweep; locked cards, empty belt slots, and spent spells remain legible and inert. No hidden state is required to operate the battle.

2.2 The map screen — one static decision diagram, not a minimap

The map is a separate scene (`map.tscn` plus controller) that replaces the battle and reward scenes; the screenshot after opening must show **only the map** at desktop width (V2-30 , §2.4, §7). It uses the visual language of the locked FTL-style map board — sparse indigo space, glowing route thread, event glyphs, fog-like depth if desired — as appearance only. It does not add the OUT journey graph, traversal, fog-of-war decisions, pan/zoom, or a live battlefield minimap (§2.4 , §4; STYLE-BIBLE map board's anti-clutter caveat).

Canonical layout:

1. **Top bar (8-10%):** `RETURN TO EDEN / MAP` , battle progress (`NEXT: 2/4`), current road

commander when known, and `SCRAP ###` at top-right. Scrap is the only purse shown here (`V2-30` , `V2-36`; §2.5).

1. **Left diagram (55-60%):** our ship at left, a single `NEXT ENCOUNTER` node/core variant at right, and a sparse static route thread. Draw the next encounter's node markers from its authored node table. Region colors/shape labels distinguish `REAR` , `FLANK` , `MIDFIELD` , and `FORWARD` ; the diagram is a preview, not traversal.

1. **Right column (40-45%):** opaque shop panel above encounter panel. Both panels share the deep-indigo panel/card/well ladder and never become translucent over a battlefield.

1. **Fork band (when due):** after battles 1 and 2, three named road cards occupy a clean lower band or the left diagram's bottom. Each names commander/archetype and boon. Exactly one click commits the road and starts the next battle; after battle 3 this band is replaced by one `CONTINUE TO FINALE` control (`V2-18` , `V2-19`; §2.2, E3(a)).

Map interaction rules: shop and encounter are each usable once per map open; the road is one pick when present; no additional node navigation or event set exists. Buttons use visible selected, disabled, claimed, and focus states. A map screenshot must not leave a battle HUD behind it.

2.3 Shop — mixed stock, one Scrap purchase

The shop is a panel on the map, not a collection screen. Each open offers **2-3 duplicate-free entries**, mixed among `card` , `belt` , and `spell` kinds. Every entry shows kind, name, icon, what it grants, and a printed `SCRAP` price. Prices follow the documented defaults: belt 30-45, spell 45-60, card 60-120; at least one card per open exceeds the 45-Scrap base win award so unaffordability can be demonstrated (`V2-31` , §8b, N3/N5).

The purchase button is the only action on an entry. After one purchase, the entire stock reads `CLAIMED THIS MAP OPEN` , including entries of other kinds. Underfunded entries are visibly dimmed and inert, with no `◆/◆` price. A purchased card names its new key; a belt item names its slot; a spell names its cast control. Lost cards may be bought back. No relics, upgrades, levels, packs, random bundles, sale/trade action, or second currency (`V2-31` , §4, M8/N3).

2.4 Investigate encounter — one card, explicit outcomes

The encounter panel names one eligible non-starter card, shows the odds and the three possible outcomes (`UPGRADED` , `NOTHING HAPPENS` , `DIES`) before commit, and has `SEND ONE CARD` plus `DECLINE` . After send, it resolves once and names exactly one result. `UPGRADED` immediately gives a card level; `NOTHING HAPPENS` leaves the card intact; `DIES` removes it from the deck and marks it lost. The starter pair cannot be sent, and the deck never drops below two. The panel becomes resolved after one result and cannot be replayed during that open (`V2-32` , `V2-33`; M5; E2(a); §8b).

2.5 Consumables belt and spells

The belt is a battle-HUD support surface, not a separate screen. It has **four fixed slots**. Each slot contains one consumable item and its current charge count; a blank slot says `EMPTY`. The primary activation input is the number row **1 / 2 / 3 / 4**, printed on the slot. It is distinct from Q/W/E/A/S/D card keys, the economy button, and spell controls. One activation removes exactly one charge and shows the existing catalogue effect; zero charges are inert and error-free. Keep the catalogue/ledger shape from `KIT_DEFS / run.kit`, including a maximum of three charges per item id. The belt carries consumables only under E6(a); a `kind:build` turret/bunker charge is excluded (`V2-34`, §2.6, §8a E6, §8b N2/N4).

Spells are held outside the four belt slots. Each appears on a separate `CAST` control with its icon, name, description, and `READY / SPENT` state. Click or keyboard-focus + activate that control; it must not claim a card key, belt number, or economy button. Use the shipped fixed target convention: offensive AoE at the enemy's deepest incursion and support/heal at our line. Under E4(a), casting costs nothing beyond consuming the one spell; no Scrap/♦/♦ is charged at cast. Uncast spells ride forward; spent spells do not. The existing catalogue content is the four shipped definitions: Orbital Strike, Med-Wave, Rally Cry, and Frag Pack; the shop may offer the spell entries and belt items according to their kind (`V2-35`, §2.6, N3, E4(a)).

2.6 Scrap and the three-resource boundary

The map/shop top bar owns the `SCRAP` balance. On a win, the result surface names the award and adds it once; on loss, no award is added; a retry pays only when it finally wins. Purchases subtract the printed price exactly. New Campaign resets Scrap to 0. The recap lists Scrap earned and spent.

The boundary is absolute: ♦ minerals are battle-local and pay cards/economy unit/bunker **only in battle**; ♦ gas is battle-local and pays exactly the six per-unit tech axes plus special-card gate; Scrap is run-scoped and shop-only. Scrap never appears in the battle HUD and never pays for a unit, bunker, gas axis, conversion, or cast (`V2-14`, `V2-27`, `V2-31`, `V2-36`; §2.5; M7/N1/N3/N5).

3. Vocabulary and art direction

3.1 Node vocabulary (single source of truth)

Use one data record per node:

```
node = {
  side:  "p" | "e",
  region: "rear" | "flank" | "midfield" | "forward",
  pos:   Vector2,
  yield: { min: int, gas: int }
}
```

`rear` means behind that side's base; `flank` is off the base-to-base axis; `midfield` and `forward` are contested/up-field regions. Each encounter authors its own table. Both sides mirror roles but need not clone coordinates. Every table has at least one rear node per side and at least one node outside both rear pockets. Nodes do not change side or become capturable during battle. The map reads the same table to preview the next encounter (`v2-25` ; §2.3; M1/B0/B1).

3.2 Bunker vocabulary

Call the one structure **BUNKER**, never turret, extractor, foundry, bulwark, or a generic building system. It is a player-owned, mineral-bought, static shooter: 60 ♦ default, 260 HP, 9 damage, 1.4 shots/s, range 170; one standing at a time, no movement blocking, no enemy-placed bunkers, no building ledger/queue/upgrade. Its dedicated control uses the unit hover/legal-zone placement model; its projectile visibly travels and impacts. The reference's `turret` definition is the numeric anchor only; the operator's cost, travel, enemy damage, and death requirements are new (`v2-28` , B2, \$0, \$4, \$8b).

3.3 Visual rules by screen

The operator locked the **colorful/warm** direction; no new global look direction is proposed (`EDEN-COMBAT-DIRECTION.md` 11:09 art answer; `STYLE-BIBLE.md` status). Apply the bible's whole-screen rules:

- **Battle:** dirty saturated field; warm sky/earth; teal ally left, ember enemy right, neutral hot center; small chunky-slim units with thick dark outline, role accents, rim lights, and contact glow.
- **UI/map/shop:** pure saturated deep-indigo glass, opaque and visually cutting through field haze; panel `#0B0B2E` , card `#23234F` , well `#05051A` , edge `#2D2D7F` ; ally border `#1CC7C7` , enemy border `#FF4A4A` , rare `#E026FF` ; disabled fill `#3E3E6A` with light `#C7C7E0` text.
- **Roles and resources:** minerals ♦ `#A0EFFF` , gas ♦ `#FF7A1A` , stats `#FFCC00` , role tags `#9FB4C7` , luxury/rare `#FFD324` ; never turn currency into identity color.
- **Type:** embedded Saira Condensed from `assets/fonts/` , all labels/buttons/headers uppercase, operable text 600–800 weight, titles 800/900, body 400–600. Use the approved cream shaded fill, black outline, and shadow treatment. Ship `0FL.txt` ; no runtime webfont or network fetch.
- **New screen rules:** the map is sparse and airy despite the FTL visual reference; shop and encounter cards follow the locked shop panel skeleton; belt/spell controls are compact support cards beside the battle card rail, never a second visual hierarchy above cards.

4. Art pipeline — first-class workflow

4.1 Ownership and production

1. **Farnsworth / Project Designer** owns the visual brief, style-bible mapping, asset acceptance checklist, and the operator review packet. The brief may not change gameplay or invent a new look.

1. **PM dispatches an assigned Worker (Fry or Bender)** to produce/import the asset. The worker may

use an approved image-generation pass for concept exploration or a vector/raster drawing pass for final production. No art specialist or external network dependency is assumed by the current roster; the PM assigns the lane.

1. **Final art source:** use editable SVG for flat geometric icons, markers, and the bunker where practical; use lossless RGBA PNG for rasterized finals and for the map backdrop/core variant. Generated raster concepts are review references, not automatically shippable source. Keep the source/brief and final export paired, with dimensions, palette, transparent-background rules, prompt/tool provenance when generated, and license/provenance notes.

1. **Godot landing:** final runtime files land under `res://assets/` with stable names, for example:

`assets/ui/map_backdrop.png` , `assets/ui/map_markers/{shop,encounter,rear,flank,midfield,forward}.png` , `assets/ui/kit/{orbital,medwave,rally,frag}.png` , `assets/sprites/structures/bunker.png` , and `assets/sprites/structures/enemy_core_rogue.png` . SVG may remain as the imported Godot source when its rendering is stable; otherwise export PNG and retain the SVG in the art-source folder. Godot `.import` files are generated by the engine, not hand-authored.

4.2 Approval and landing gate

For each new art type (map, marker set, bunker, core variant, kit icons):

1. Farnsworth writes a one-page brief tied to the exact locked palette, silhouette, screen zone, dimensions, and relevant V2 criteria. If the brief proposes a new look direction, stop and obtain Brick's direction lock before any build. Here the global direction is already locked, but these art types are still gaps under the bible's "show before build" rule.

1. Worker produces a concept sheet with the asset in its intended screen composition, not an isolated thumbnail only. Designer checks the whole shot against the style bible and rejects drift in color, scale, silhouette, clutter, or UI/field separation.

1. Show the concept sheet to Brick. Record explicit approval, requested changes, or rejection with date and artifact hash. No builder codes the affected screen/art type before approval.

1. Worker produces the final source and export. Designer verifies dimensions, alpha, palette role, source/provenance, file hash, and that it lands at the named `res://` path. A generated asset is never approved from prompt text alone.

1. The worker shows the live Godot screen using the final asset. Brick's pre-QA gate then reviews the frozen local build; only after Brick approves QA does Scruffy inspect the frozen hash (`CADRE-INTAKE.md` D4/\$Gates).

This pipeline does not generate or land art during this design pass. The global colorful/warm direction is already locked; the operator must approve the new asset-type references before implementation.

5. Consolidated missing-asset list

The current project was inspected read-only at commit `2265e89` . It has existing UI/backdrop art, Saira Condensed 400/600/700/800/900 plus `0FL.txt` , eight rebel-side sprite files including the economy node, eight alien-side sprite files including the economy node, two node textures, and four structure textures (`ally_core` , `enemy_core` , `ally_barrier` , `enemy_barrier`). It has no map, shop, battle entity system, or art for the following:

#	Missing asset	Required use	Source/final plan	Trace
A1	Spell icons: Orbital Strike, Med-Wave	Spell shop/cast controls	SVG or vector/emoji-equivalent approved against bible; final PNG/SVG under <code>assets/ui/kit/</code>	V2-31, V2-35, §2.6, §6.1
A2	Consumable icons: Rally Cry, Frag Pack	Four-slot belt and mixed shop	Same kit icon family; each icon must read at small HUD size and carry no card-key semantics	V2-31, V2-34, §2.6, §6.1
A3	Map backdrop	Full standalone map scene	Sparse deep-indigo/star/nebula treatment; generated or drawn PNG, not a battlefield screenshot; must not imply traversal	V2-30, §2.4, §6.1; STYLE-BIBLE map rules
A4	Map marker/icon set	Shop, encounter, roads, and node-region preview	Distinct small glyphs/rings for shop, encounter, road, and rear/flank/midfield/forward; use palette windows without teal-wash/yellow-sea	V2-25, V2-30, §2.3-§2.4, §6.1
A5	Bunker sprite	One player-placeable structure	Compact static defensive silhouette; vector body is allowed but must still receive operator review	V2-28, §6.1, §8b
A6	Second enemy core variant	Prove the core slot is data-driven across encounters	Current project has only <code>enemy_core.png</code> ; add a distinct variant such as <code>enemy_core_rogue.png</code> , with name/HP data; do not add core AI	V2-26, A4, §4, §6.1

Explicitly reused, not missing: existing ally ship/core, enemy core as variant 1, ally/enemy barriers, rebel/alien rosters and node sprites, existing menu/backdrop/frame/title art, and embedded Saira Condensed weights/license. No art is owed for heroes, extra factions, additional building kinds, hand-drawn animation frames, or a live minimap (`EDEN-REQUIREMENTS.md` §4, §6.1; project inventory).

6. Ordered build tasks and independent checks

The sequence is skeleton first, then system chrome, then art polish. Each task has one observable pass condition and stays in the named REV 6 workstream; it is not a silent re-cut of W-C8/W-C9.

#	Task / owner handoff	Workstream	Independent pass check
T0	Freeze source manifest, fresh-export preflight, and approve the art-type briefs	Foundation / art gate	<code>localhost:8888</code> serves the fresh export; source mtimes precede export; asset manifest and every new-art concept have a recorded path/hash; Brick has approved the briefs. No QA yet (V2-01; §6.1; D4).
T1	Build scene/state skeleton: menu → battle → reward → map → battle, with map as a separate scene	Foundation	Starting a local run reaches each placeholder scene; opening map replaces the battle so a screenshot contains only the map; no battle logic is changed (V2-02, V2-16, V2-30).
T2	Build battle field frame and entity/furniture anchors	W-C8a	Desktop screenshot shows the wide field, both cores/variants, barriers, empty first frame, and reserved HUD band; no units are required to pass this skeleton (V2-14/15/26; §2.1).
T3	Build card rail, hover placement indicator, economy/build controls, and HUD truth blocks	W-C8a/W-C8d	Battle 1 visibly shows Q/W cards, locked remaining slots, ♦/◆, core bars, enemy income, economy button, and bunker button; no control is dead or ambiguously keyed (V2-06, V2-11, V2-14, V2-24, V2-28).
T4	Build live combat movement/targeting/attack/death and lane pressure	W-C8b/W-C8c/W-C8e	A placed unit advances and attacks nearest target; concentrated left/right placements produce visible lane pressure; enemy deployments track live income; cap is observable (V2-12/13, V2-22/29; C8/C9).
T5	Add authored node data and economy-unit harvest loop	W-C8a/b/c/e	Two consecutive battles show different authored node positions on both sides, required regions are visible, economy units work nodes, and killing them lowers income; no capture mechanics (V2-24/25/29; §2.3).
T6	Add per-unit gas investment and bunker behavior	W-C8c/d	One unit's gas row changes only that unit; bunker costs 60 ♦, places once, fires a travelling projectile, takes damage, dies, and does not block movement; no second building path (V2-10, V2-27/28).
T7	Add cores, battle end, reward triad, run persistence, and Scrap award event	W-C8 + run state/W-C11	Two enemy core variants appear by encounter; destroying a core ends the fight; win names one-time Scrap award, loss pays none, reward triad remains exactly one choice (V2-16, V2-20/22/26/36).
T8	Build standalone map diagram and road cadence	W-C9	After battles 1/2/3 the map scene opens; next core and node markers match data; 3

#	Task / owner handoff	Workstream	Independent pass check
			roads appear only after battles 1-2, no road appears after 3, and Continue starts battle 4 (V2-18/19/30).
T9	Build mixed shop and Scrap balance	W-C11	Map shop shows card/belt/spell entries with Scrap prices; one purchase disables all entries; exact balance changes, unaffordable entries inert, New Campaign resets to 0; no shop item has ♦/♦ price (V2-31/36).
T10	Build encounter roll, card acquisition/loss, and recap state	W-C9/run state	One non-starter card send shows all named outcomes before commit; only “dies” removes it; row/HUD/recap update; shop can re-buy it; six-card path remains 2 + 3 shop + 1 encounter card under E5(a) (V2-23, V2-32/33, §8a E2/E5).
T11	Build four-slot belt with separate number input	W-C10	Bought consumable appears in a slot; 1-4 spends exactly one charge and shows effect; empty slot is inert; card keys/economy button do not activate it; no structure item under E6(a) (V2-34).
T12	Build spell controls/effects/persistence	W-C10	Bought spell appears outside belt, casts once from its own control at the fixed described point with no cast price under E4(a), spent state is visible, and uncast spell rides forward (V2-35).
T13	Integrate approved art and style states	Art + UI chrome	Full battle/map/shop/encounter shots match the bible’s palette, type, ladder, opacity, role accents, focus/disabled/empty/claimed states; final files match manifest hashes (V2-14, V2-30-36; STYLE-BIBLE whole-screen test).
T14	Fresh local export, operator review, freeze, then QA approval gate	Delivery	Fresh served hash is presented to Brick with one change line; only after Brick explicitly approves QA does Scruffy verify; any unverified claim is reported as unverified (V2-01/02; D4; §3 gate).

Workstream accounting: W-C8 remains approximately 9-14 builder-days, W-C9 2-3, W-C10 2-3, W-C11 1-1.5, for approximately **14-21 builder-days**, with art work budgeted separately as EDEN-REQUIREMENTS.md §6 states. T0/T13/T14 are gates, not hidden additions to those estimates.

7. Explicit deviations and unresolved calls

7.1 Deviations from REV 6: none to gameplay scope

No acceptance criterion, resource boundary, OUT item, workstream estimate, or operator-authored combat rule is changed here. In particular, the map is not expanded into the FTL journey graph, the belt does not add a building path, Scrap is not a gas sink, and the battle is not rebuilt from the old HTML5 step-sim (EDEN-REQUIREMENTS.md §1, §2.4–§2.6, §4, §6; combat direction C1–C9).

7.2 Named design resolutions (not scope deviations)

1. **Belt input = number row 1/2/3/4.** This resolves N4 using the §8b starting point; the numbers are visibly printed and do not collide with Q/W/E/A/S/D, the economy button, or spell controls (V2-34; §8b).

1. **Four belt slots and three charges per item id.** This uses N2's upper proposal and the shipped `stockCons` ceiling; spells remain outside slots (V2-34/35; §2.6, §8b).

1. **Spell cast control = explicit button with focus activation, fixed target, zero extra cast cost.**

The control ownership is needed to keep spells outside card/belt inputs; fixed targets and E4(a) follow the shipped model and §8b (V2-35; §2.6, E4).

1. **"Map" is a static decision diagram.** This is the smallest honest surface specified by §2.4; it borrows the locked map board's visual grammar while deliberately omitting the board's navigable FTL feature set because §4 keeps traversal out. This is a presentation resolution, not a new map criterion (V2-30; §2.4, §4; STYLE-BIBLE map board).

1. **Generated art is not automatically final art.** The pipeline requires a concept sheet, whole-shot visual review, Brick approval, then a hashed final import. This operationalizes the bible's "show before build" rule; it does not introduce a new look direction.

7.3 Three operator calls still held open

The design uses the documented defaults and does not pretend they are closed: **E4(a)** zero extra cast cost; **E5(a)** whole-card encounter reward; **E6(a)** no structure belt item. If Brick overrides one, the affected surface and task must return to design before PM dispatch. Any unstated gameplay change remains an escalation to Hermes, not a Designer assumption.

8. Handoff status

Not handed to Leela. This artifact is ready for Brick's explicit design sign-off. After approval, Farnsworth will update the status block with the exact approval wording/date and send the artifact plus

the ordered task list to Leela; until then, the PM must not dispatch build work against these choices.

9. Design verification record

Read-only checks completed 2026-09-17 before this artifact is offered for sign-off:

- REV 6 source is `/home/openclaw/.openclaw/workspace/rogueds/docs/EDEN-REQUIREMENTS.md` at 1,784

lines / 168,407 bytes; the combat authority is 209 lines / 15,652 bytes; the intake is 116 lines / 8,391 bytes. The locked style contract is `STYLE-BIBLE.md` , 492 lines / 48,314 bytes.

- The Godot project is `/home/openclaw/hermes-godot` , `ReturnToEdenAlpha` , Godot 4.7 / GL

Compatibility, main scene `res://menu.tscn` , and its working tree is clean at the stated baseline commit. The present source has `menu.tscn` , `game.tscn` , `scripts/menu.gd` , and `scripts/game.gd` ; no map scene, shop scene, battle entity system, or node marker asset was found.

- Existing visual inventory is the project's menu/backdrop/frame/title art, Saira Condensed weights

400/600/700/800/900 plus `0FL.txt` , eight rebel-side sprite files, eight alien-side sprite files, `rebel_node.png` / `alien_node.png` , and `ally_core.png` , `enemy_core.png` , `ally_barrier.png` , `enemy_barrier.png` . `enemy_core2` is named by the bible but is not present in this project checkout.

- No `bunker.png` , map backdrop/marker set, or spell/consumable icon files exist under the project's

runtime assets. The requirement's emoji/vector allowance is therefore an explicit fallback, not a claim that the requested art already exists.

- A source-text audit confirms the artifact contains every required new criterion `V2-34` , `V2-35` , `V2-36` , every new work slice `W-C10` , `W-C11` , and the open-call/default IDs `E4-E6` , `N1-N5` , with the applicable `M6-M8` and `V2-30-V2-33` traceability. No code or project file was modified.

This record proves the design inputs and project baseline were inspected; it does not claim a build, visual render, art generation, or QA result. Those are downstream tasks behind the operator gate.
